Startpage review 2019

Dubbed the world's most personal search engine, StartPage seems to fit the bill for anyone who wants a confidential and secure Google alternative. But is this the case, and does the claims made by search engine StartPage conclude? This StartPage review will look at one of the main competitors for Google's crown, and dig deep into what makes this search tool worth trying out. And we'll also assess how it measures against other alternatives, with startPage vs DuckDuckGo's full comparison to relying things around. But first, why should you use a private search engine anyway? Understanding what doThere's personal search engine is a time when searching the web is an innocent activity. When companies like Lycos, Webcrawler, Altavista, and – yes – a young upstart called Google competes, some people complain about the impact of personal privacy. However, this has changed when Google established an effective monopoly in the search engine sector. According to many search engine experts, Google has abused its rankings, running rough on user privacy. Users have been shifted through tracking cookies and IP logging; their emails have been exposed to app developers; Google has made billions from selling user data without sniffing out consent, and what's more, the company has leaked data like filters. Private search engines work to mimic or build Google functionality while rejuvenate the defect. Most importantly, they want to protect user identities, while looking for creative ways to fund their operations. Not all of them managed to score high goals in the privacy line, but at least they tried. So let's find out where StartPage is located in a new world of personal search engines. What is StartPage? While the popularity of private search engines has increased in recent years, many of the most popular options actually have a relatively long history. The StartPage search engine is a great example, with stretch roots back to 1998.Founded by David Bodnick as (less interesting named) Ixquick, the search engine bought by Dutch company Surfboard Holding BV in 2000, which still operates the StartPage site. From the outset, the search tool has sought to advance privacy. In fact, StartPage is among the first operators to combine the front end of a standard search with a web proxy, allowing users to search anonymously. Ixquick was rebranded in 2009, StartPage.com, now offers a very Google-esque search facility. Users will feel right at home with its interface, but behind the surface, things look very different. The main features of how StartPage works engine aggregation - StartPage search engine doesn't rely on a single crawl builds its index. Instead, it rates results from 10 leading search engines (including Google), prioritizing links that appear in all cookies or 10.No in the process. Well, only one. These cookies are basically user preferences tools, keeping your basic settings for a period of 90 days (assuming you don't visit in the interim). StartMail is provided as an additional service. Including Gmail in some cases, this is a fully encrypted webmail service, offering PGP encryption – even for emails sent to them without their own encryption. Every time you search, you'll notice that each link has a subsidiary link titled anonymous views. This allows you to move from StartPage to the target site without the website knowing where you came from, or the search term that takes you there. So it works around major issues with the Google system. Users should also note that most of Google's basic features are included in the StartPage search engine. For example, you can search for images and videos, users can filter by time and date, and results can also be filtered by language. There's even a mapping app to find a reliable direction. How does StartPage actually work? Some of the features involved are quite innovative – even 20 years after the StartPage search engine first appeared, and it's worth seeing it in more detail. First, an anonymous view. In this setting, search engines use their own IP addresses to access third-party websites. When it does this, the website will only see search engines and no data about your own individual location. Additionally, StartPage doesn't transfer full user agent profiles to target websites. Instead, user agents only include cleaned versions, which only alert sites to the browsers used. That way, you can benefit from browser optimization in effect on the site, but site managers can't track much about your device. Secondly, there is a StartPage search engine business model. With mainstream search engines like Google, users are their main assets. They build profiles about their tastes and movements, which can be sold for huge profits. StartPage doesn't do that. However, the company still needs to make money. To do so, it delivers sponsored advertising with every search. You'll see these ads at the top of your search results (clearly marked with ad words in a small box). These ads aren't targeted based on personal profiles or search history. They are only associated with the search terms you use. Therefore, although they may not always be 100% relevant to your interests, the systems used to choose them do not harvest your personal data. Does StartPage safeWe have covered anonymous search and search engine business model StartPage, and both aspects of the company suggest that it is a rather promising Google alternative. Are there any other things we need to know about safety generally? Actually, yes. one thing, StartPage doesn't store any data about what you're looking for. Therefore, there is no scope for profiling, and if law enforcement bodies come to search companies demanding data, they need to leave empty-handed. The company has also been a long-term critic, vocal espionage of the NSA, particularly the PRISM program not included by Edward Snowden. And it states categorically that it has submit any amount of data to the US government. In addition, the StartPage search engine uses encryption by default. Every page associated with this site is protected by HTTPS encryption, so outsiders don't have access to the search content performed. For all these reasons, this StartPage review is pretty positive about what the tools have to offer, and how its creators think about the privacy of search engines. However, there is one aspect of final security that needs to be mentioned. Are there StartPage search engine viruses? In the past, StartPage search engines have been linked to viruses that automatically set the engine's front page as the user's default home page. Apparently, this is due to a virus called Trojan-StartPage, and the company itself has nothing to do with it. When users use fake search engines, it puts them at risk of contracting further malware and submitting personal information. So StartPage has provided guidance on what to do if this happens to you. And, as ever, it's a good idea to update your antivirus and antimalware system – whatever search engine you work on. But as far as we can say, this is not a reason to downgrade our StartPage reviews. StartPage vs DuckDuckGoFinally, we need to find a StartPage search engine in the wider ecology of Google's alternatives, and comparisons with DuckDuckGo are the perfect way to do so. DuckDuckGo has the same emphasis on privacy and respect, so you might want to try both to see which ones tick your box. To help you decide, here's a comparison table with key information. Owning companyStartPage: Surfboard Holding B.V (based in Netherlands)DuckDuckGo: CEO Gabriel Weinberg (with significant venture capital investment)Launched inStartPage: 1998 (rebranded in 2009 and 2016)DuckDuckGo: 2008Number using the index of 10 leading search engines (including Google)DuckDuckGo: the last estimate of 120 million (2011)Number of queries dailyStartPage: at least 5.7 millionDuckDuckGo: 30 millionAdvertising on search engines? StartPage: YesDuckDuckGo: YesSecurityStartPage Features: full encryption of HTTPS/TLS for all searches, view anonymous websites via proxy, no user search logs, minimal use of cookies, secure emails provided, Dutch-based, no targeted ads OfDuckGo: using TLS encryption for all searches, US-based and using Amazon servers for hosting, offering toR exit enclaves, no profile-based ads – just keywords, encrypted web links can be provided When you use StartPage, we don't record your IP address, do not record which browser you use (Internet Explorer, Safari, Firefox, etc.), we do not record your computer platform (Windows, Mac, Linux, etc.), and we do not record the words or phrases you are looking for. However, once you leave StartPage, by clicking on your search results can be viewed, recorded, and tracked by all the sites you visit, plus you can be viewed and targeted by all their advertising and partners and affiliates. StartPage offers very useful tools to protect your privacy even if you leave our website. If you do a very personal or sensitive search and you don't want your visit to a third-party tracked website, you can use the StartPage Proxy (shown next to each search results). The proxy allows you to visit third-party websites via StartPage without anyone, including its websites and advertising partners, seeing you. Our proxy services are unique, and the privacy protections provided are not available through any other search engine. By Damayanthi J. aged over a year See more answers (2) (2)
